Please note:
When used for controlling a spool with float position,
the output should be limited to 34 → 66% of Vcc.
Customer is responsible for ensuring this.
This is a safety issue!

OBS! Når signalet inverteres bytter signaltilpasnings-potentiometerne "retning" det vil sige A bliver til B og B til A.

NOTE! When the signal is inverted, the signal adaptation potentiometers change "direction" A becomes B and B becomes A.

NB! Bei Umkehrung des Signals tauschen die Signalanpassungspotentiometer die "Richtung", d.h. A wird zu B und B zu A.

N.B! Quand le signal est inversé, les potentiomètres d'adaptation des signaux font échange de "direction", ce qui signifie que A devient B et B devient A.
