

Hydraulic motors OMV

Low speed high torque motors

A wide range of hydraulic motors

Danfoss is Europe's largest producer of low speed high torque hydraulic motors. We can offer more than 1600 different hydraulic motors, categorised in types, variants and sizes (incl. different shaft versions).

The motors vary in size (rated displacement) from 8 cm³ to 800 cm³ per revolution.

Speeds range up to approx. 2500 rpm for the smallest type and up to approx 600 rpm for the largest type.

Maximum operating torques vary across the ranges from 1.3 daNm to 250 daNm (peak) and maximum power-outputs from 2.0 kW to 64 kW.

Characteristic features:

- Smooth running over the entire speed range
- Constant operating torque over a wide speed range
- High starting torque
- High return pressure without use of drain line
- High efficiency
- Long life under extreme operating conditions
- Robust and compact design
- High radial and axial bearing capacity
- For applications in both open and closed loop hydraulic systems
- Suitable for a wide variety of hydraulics fluids

Variants

Standard/Extended Programme

The Danfoss metric motor programme has been divided into standard ranges and extended ranges.

The standard ranges are characterised by technical features appealing to a large number of applicatons.

The extended ranges are characterised by motors adapted to specific applications and comprising the following variants among others:

- Motors with corrosion resistant parts
- Wheel motors with recessed mounting flange
- OMP, OMR motors with needle bearing
- Short motors without bearings
- Ultra short motors
- Motors with integrated drum brake
- Motors with integrated negative holding brake
- Motors with integrated flushing valve
- Actuator motors
- Compact motors; type OMN
- Motors with speed censor
- Motors with tacho connection

Planetary gears

Danfoss represents a complete range of planetary gears with flanges and couplings designed for Danfoss hydraulic motors. The combination of motors and gears makes it possible to obtain completely smooth running at fractional speeds and torques up to 65.000 daNm.

Examples of Danfoss hydraulic motor applications

- Machines for agriculture and forestry
- Mining machinery
- Construction plant equipment and access platforms
- Grass cutting machinery
- Special vehicles
- Ship's equipment and winches on fishing vessels
- Machine tools
- Woodworking and sawmill machinery
- Plastic and rubber machinery etc.

Survey of literature with technical data on Danfoss hydraulic motors

Detailed data on all Danfoss motors can be found in our motor catalogue, which is divided into 4 individual subcatalogues:

- General information on Danfoss hydraulic motors: function, use, selection of hydraulic motor, hydraulic systems, etc.
- OML and OMM technical data on small motors.

- Technical data on medium sized motors: OMP, OMR and OMH
- Technical data on large motors: OMS, OMT and OMV

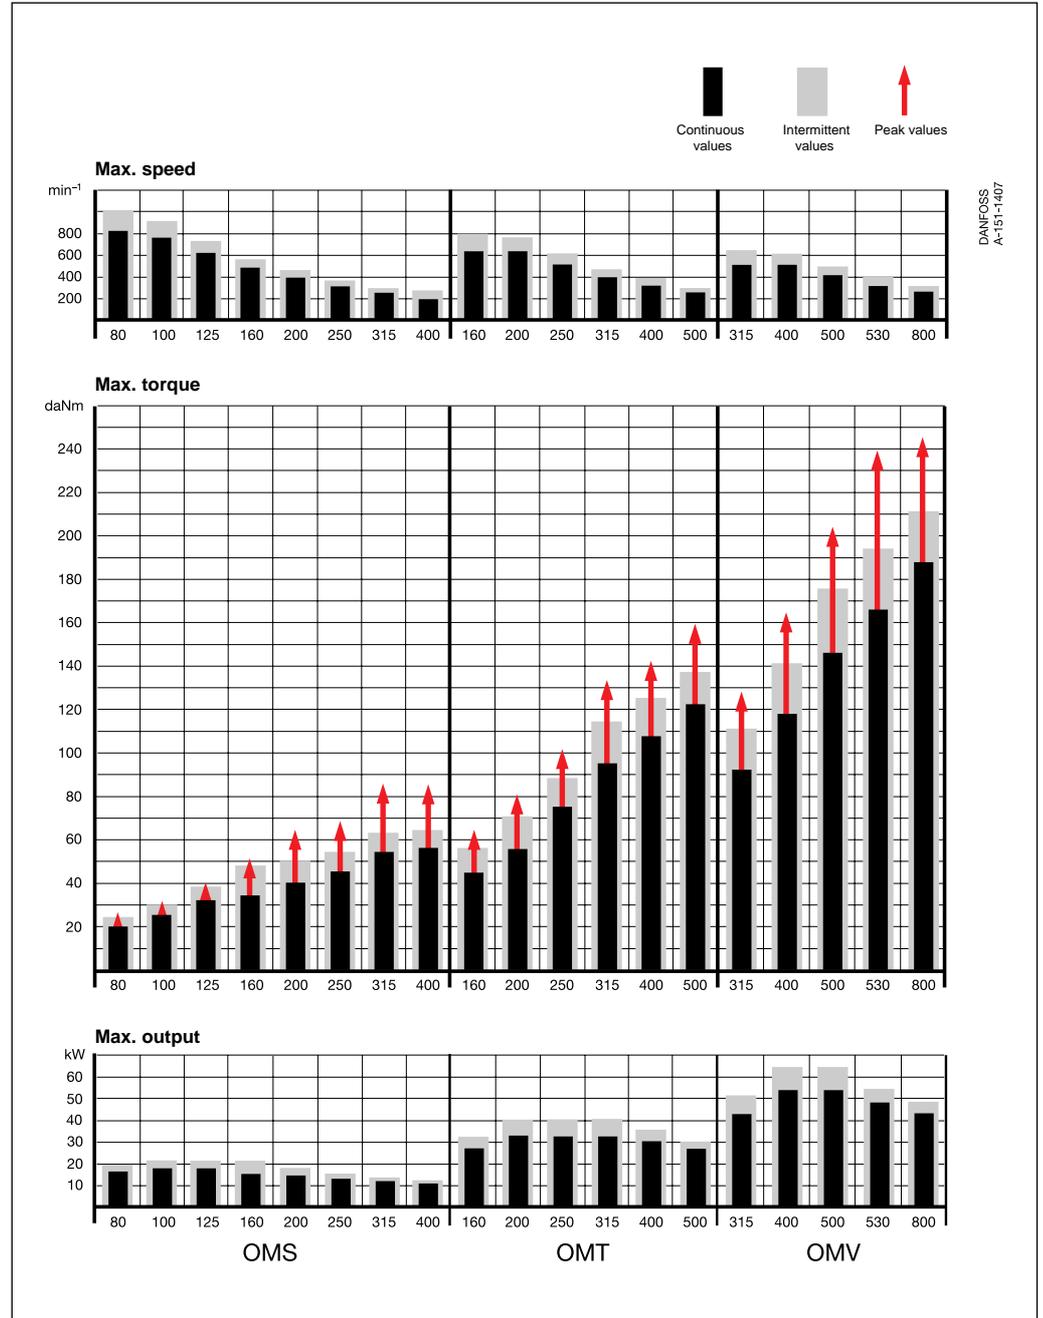

A general survey brochure on Danfoss hydraulic motors giving a quick motor reference based on power, torque, speed and capabilities.

The bar diagram above is used for a quick selection of relevant motor sizes for the application. The final motor size can be determined by using the function diagram for each motor size.

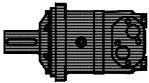

The function diagrams are drawn on the basis of actual tests on a representative number of motors from our production. The diagrams apply to a return pressure between 5 and 10 bar when using mineral based hydraulic oil with a viscosity of 35 mm²/s and a temperature of 50°C. For further explanation concerning how to read and use the function diagrams, please consult the paragraph "Selection of motor size" in our catalogue "General Information".

Thread designation
The designation G for pipe thread replaces the previous designation BSP.F, cf BS/ISO 228/1.

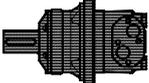

- The function diagrams for
- OMS can be found on pages 7 - 10
 - OMT can be found on pages 25 - 27
 - OMV can be found on pages 40 - 42.

- ²⁾ Peak load: The permissible values may occur for max. 1% of every minute.
- ³⁾ Operation at lower speeds may be slightly less smooth.

Max. permissible shaft seal pressure

OMV motors have incorporated check valves

In applications without drain line the pressure on the shaft seal will never exceed the pressure in the return line.

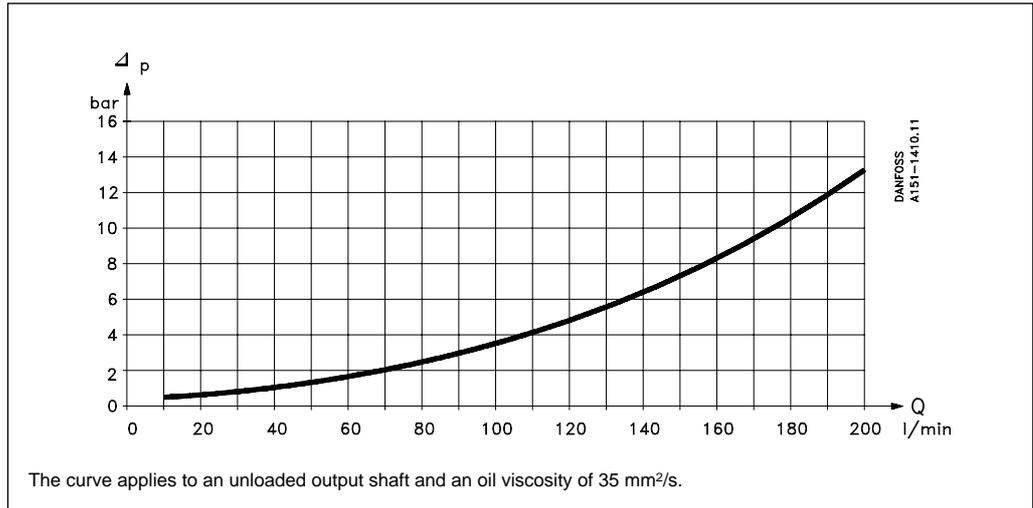

Oil flow in drain line

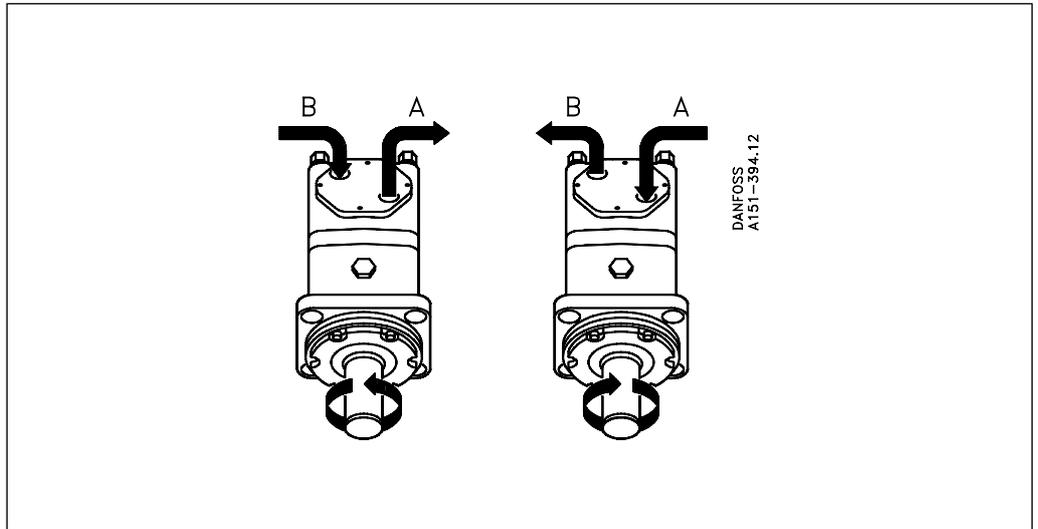

The table shows the max. oil flow in the drain line for all OMV motors. The values are measured at a return pressure less than 5-10 bar.

Pressure drop (bar)	Viscosity (mm ² /s)	Oil flow in drain line (l/min)
140	20	3
	35	2
210	20	6
	35	4

Pressure loss in the motor

Direction of shaft rotation

Permissible shaft load for OMV and OMVW

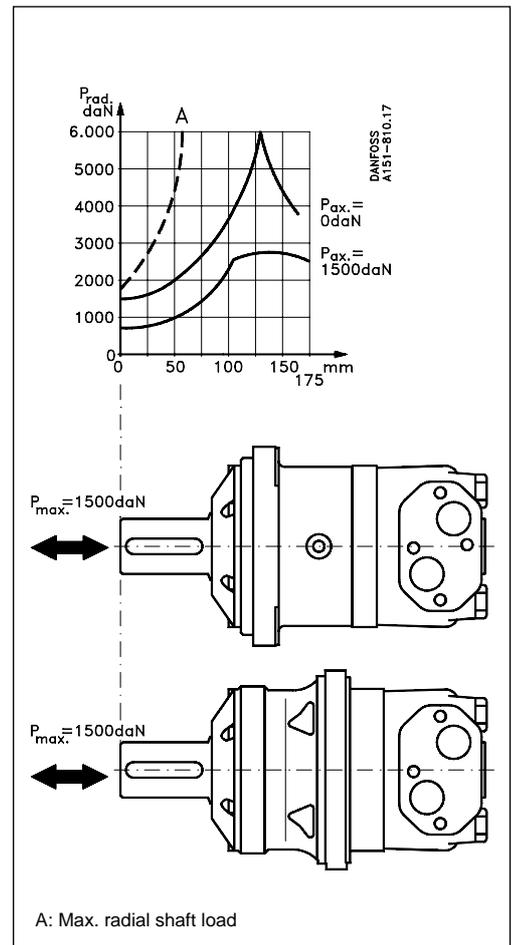

The output shaft runs in tapered roller bearings that permit high axial and radial forces.

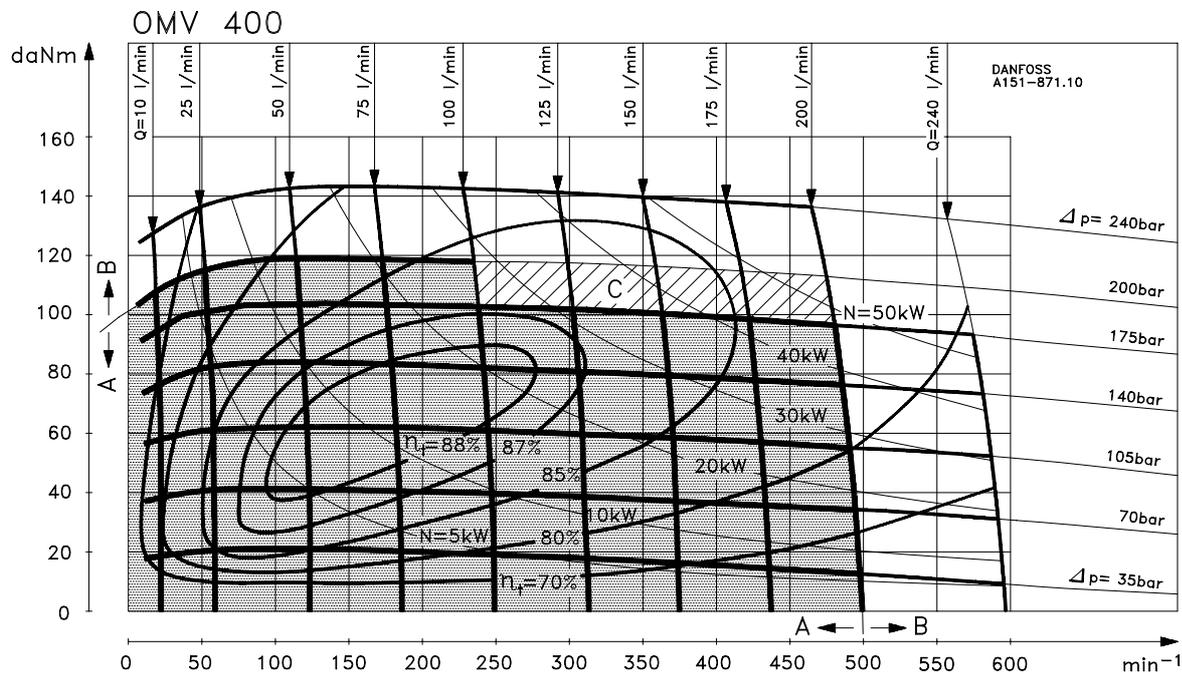

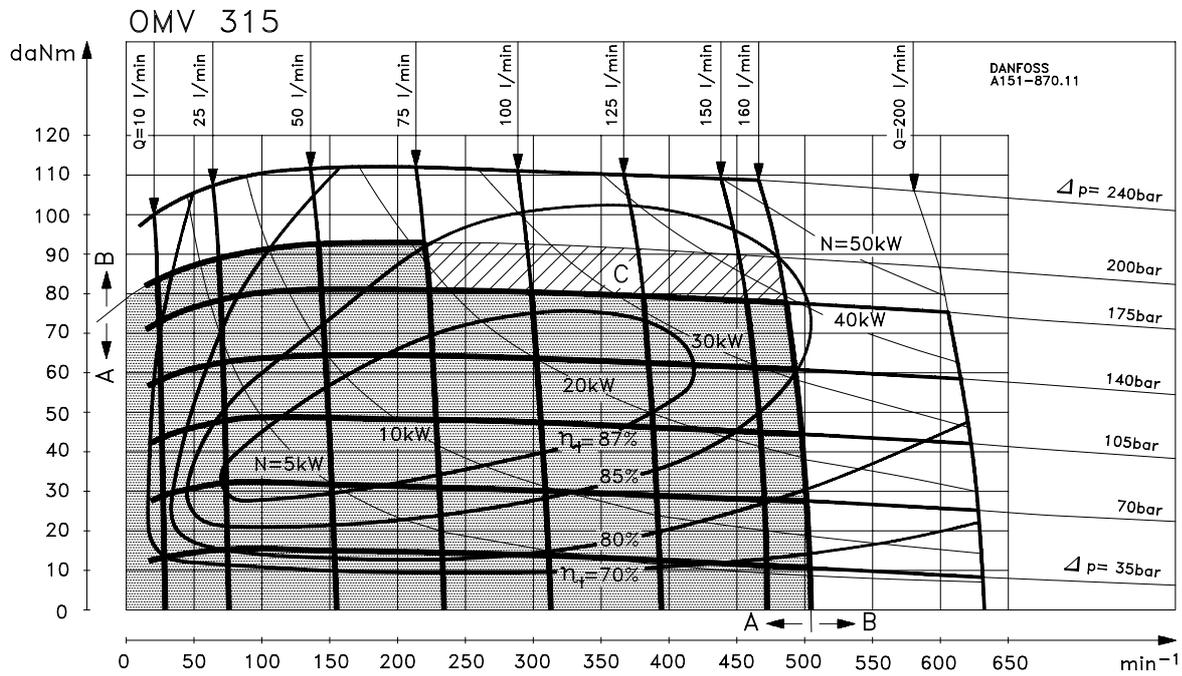

The permissible radial load on the shaft is shown for an axial load of 0 and 1500 daN as a function of the distance from the mounting flange to the point of load application.

Curve A shows max. radial shaft load. Any shaft load exceeding the values quoted in the curve will involve a risk of breakage.

The other curves apply to a B10 bearing life of 3000 hours at 200 min⁻¹ when mineral based hydraulic oil with a sufficient content of anti-wear additives is used.

Bearing life calculations can be made using the explanation and formula provided in the chapter "Bearing dimensioning" in the subcatalogue "General information".

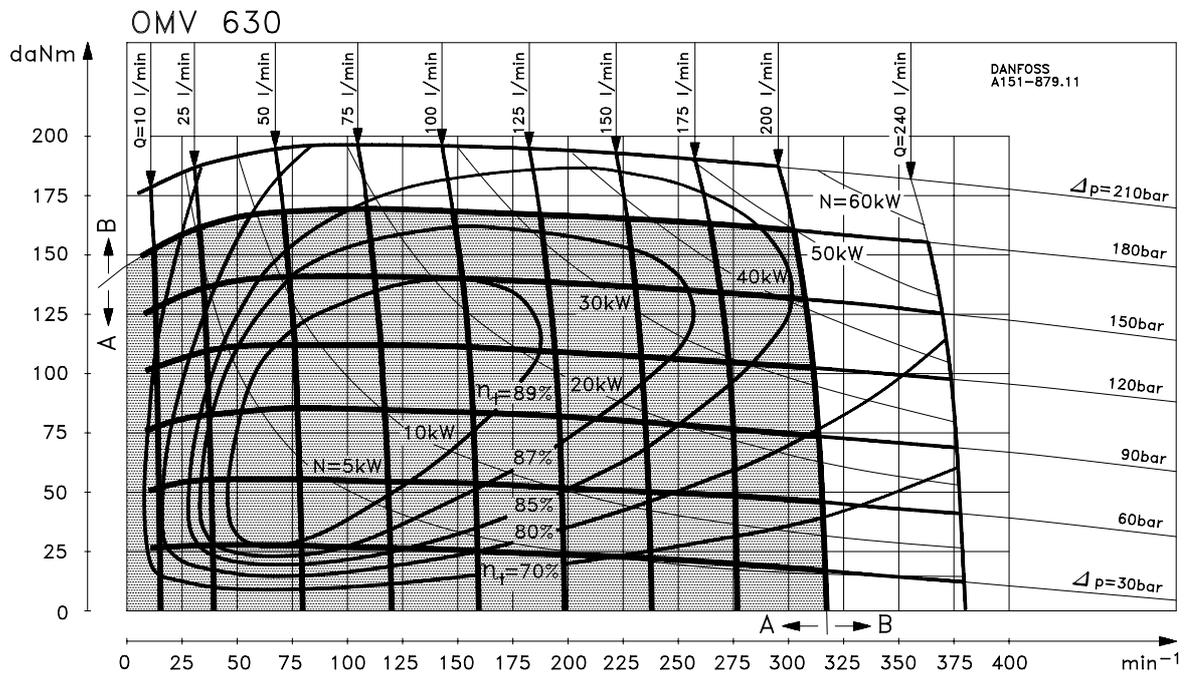

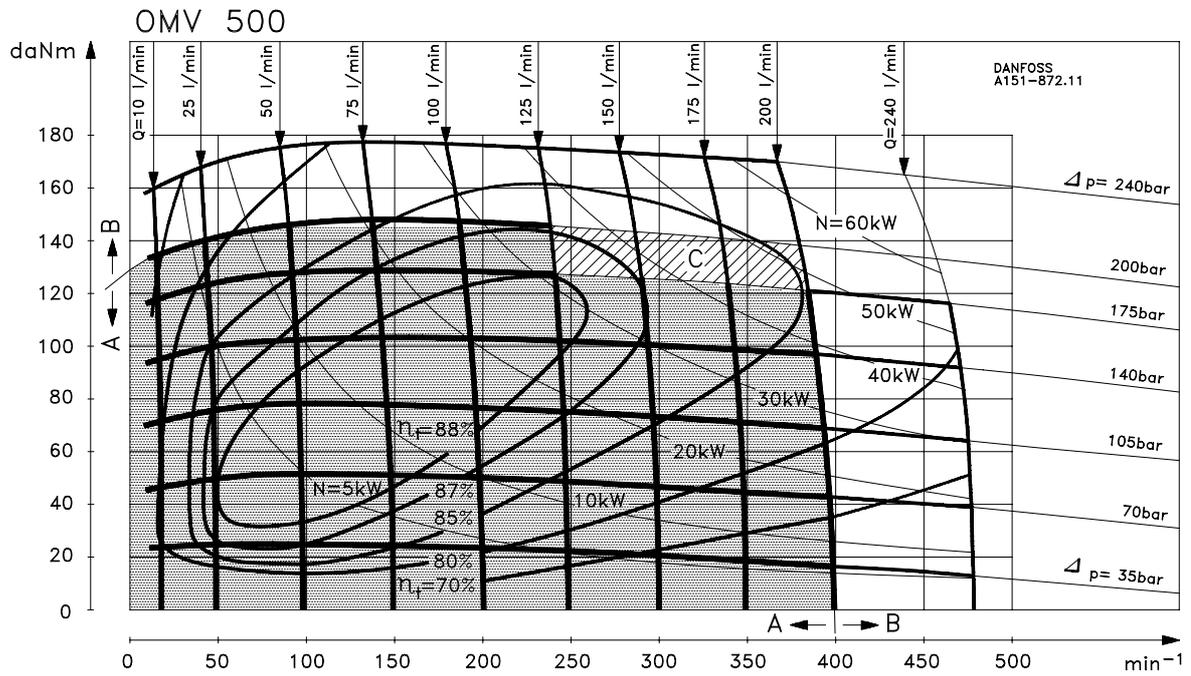

Explanation of function diagram use, basis and conditions can be found on page 3.

- A : Continuous range
- B/C: Intermittent range (max. 10% operation every minute)

Note:
Intermittent pressure drop and oil flow must not occur simultaneously.

Installing the OMVS

The cardan shaft of the OMVS motor acts as an "output shaft". Because of the movement of the shaft, no seal can be fitted at the shaft output. Internal oil leakage from the motor will therefore flow into the attached component.

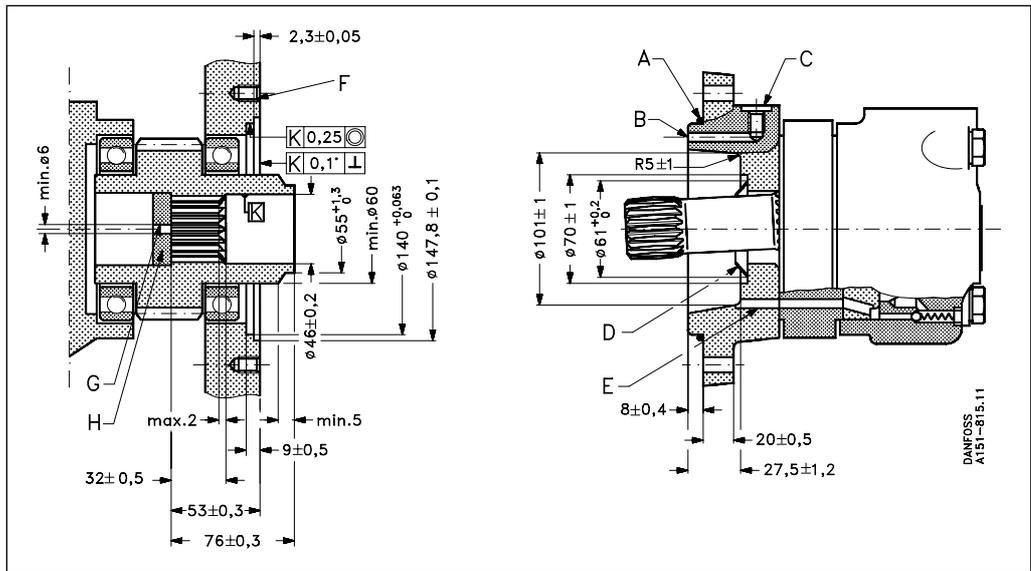

During start and operation it is important that the spline connection and the bearings in the attached component receive oil and are adequately lubricated. To ensure that the spline connection receives sufficient oil, a conical sealing ring between the shaft of the attached component and the motor intermediate plate is recommended. This method is used in the OMV.

The conical sealing ring (code. no. 633B9021) is supplied with the motor.

To ensure that oil runs to the bearings and other parts of the attached component, the stop plate must have a hole in it (see fig. overleaf).

We recommend an O-ring between motor and attached component. The O-ring (code no. 151B1041) is supplied with the motor. If motor and attached component have been separated, remember to refill before starting up. Fill the oil through the drain connection.

Dimensions of the attached component

- A: O-ring: 140 × 3 mm
- B: External drain channel
- C: Drain connection
- G 1/4; 12 mm deep
- D: Conical seal ring
- E: Internal drain channel
- F: M12; min. 18 mm deep
- G: Oil circulation hole
- H: Hardened stop plate

Internal spline data for the component to be attached

The attached component must have internal splines corresponding to the external splines on the motor cardan shaft (see drawing below).

See also SAE 8620 for further information on steel material.

Material:

Case hardening steel with a tensile strength corresponding to at least 20 MoCr4 (90 daN/mm²).

Hardening specification:

- On the surface: HV = 750 ± 50
- 0,7 ± 0.2 mm under the surface: HV = 560

* Finished dimensions (when hardened)

Drain connection on OMVS or attached component

A drain line ought to be used when pressure in the return line can exceed the permissible pressure on the shaft seal of the attached component.

If a drain line is fitted to the attached component, it must be possible for oil to flow freely between motor and attached component.

The drain line can be connected at two different points:

- 1) at the motor drain connection
- 2) at the drain connection of the attached component.

The drain line must be led to the tank in such a way that there is no risk of the motor and attached component being drained of oil when at rest.

The maximum pressure in the drain line is limited by the attached component and its shaft seal.

Motors with tacho connection
OMV T, OMVW T, OMVS T

Dimensions

Dimensions (mm)

Motor size	315	400	500	630	800
Type OMV T	246.5	253.5	261.5	272	286
Type OMVW T	178.5	185.5	193.5	204	218.5
Type OMVS T	203.5	210.5	218.5	229	243

C: M5 (4); 8 mm deep

Weight of tacho connection unit: 0,2 kg

Angular backlash

Tolerances in the connection between the motor output shaft and tacho connection give a certain angular backlash. Backlash can be defined as the angle the output shaft will turn on reversing before the tacho shaft is engaged. On the OMV motors the backlash is min. 8.0° and max. 12.1°.

Permissible load on the tacho drive of motor

- *Torque:*
0.01 Nm cont. and 0.04 Nm int.
- *Radial force in the middle of drive shaft:*
5 daN at 0-800 min⁻¹
- *Axial load:*
5 daN
