## 1 Overview 2/2-way directional seated valves type EM and EMP

Directional seated valves are a type of directional valve. As cone valves they are tightly sealed without leakage in the closed state.

The directional seated valves type EM and EMP are screw-in valves. 2/2-way directional seated valves with direct or pilot-controlled electromagnetic actuation are available. The directional seated valve type EM is available as a directional. Type EMP is a proportionally switching directional seated valve.

Appropriate connection blocks make possible direct pipe connection or manifold mounting. You can obtain additional components, e.g. a drain valve, bypass throttle valve, pressure switch or flow control valve.

Cartridge valve

Screw-in valve with individual connection block

### Features and benefits:

- Zero leakage in blocked state
- Directly switching up to approx. 3 lpm and piloted up to 160 lpm
- Minimized flow resistance even at high flow rate
- Long lifetime due to hardened valve seats

### Intended applications:

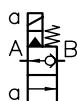

- Cranes and lifting equipment
- Road construction industry
- Materials handling, industrial trucks etc.
- Handling and assembly robots, etc.

## 2

## Available versions, main data

EMP 31 V	<a href="#">Chapter 3, "Parameters")</a>	70	400		
EMP 31 V 70		80	400		
EMP 31 V 80		100	400		
EMP 31 V 100	▪ Type ..VH with stroke limitation	160	350		
EMP 41 V					
EMP 21 S	Piloted	40	400	A → B	
EMP 21 S 10		40	400	B → A = not permitted	
EMP 21 S 20	▪ With manual emergency actuation (not detailed) (see curves, <a href="#">Chapter 3, "Parameters")</a>	40	400		
EMP 31 S		80	400		

### Note

- Maximal permissible pressure only with basic blocks made of steel.
- If other materials have been used (e.g. cast iron, aluminium), pay attention to the potentially reduced strength of the thread.

### Note

A proportional amplifier is mandatory for this valve type. For recommended components, see [Chapter 5.4, "Maintenance information"](#)

## 3 Parameters

### 3.1 General

#### General information

Description	2/2-Directional seated valve
Design	Conical seat design
Design	Cartridge valve
Material	Steel; zinc-nickel coated valve housing, hardened and ground functional inner parts
Torque	see <a href="#">Chapter 4, "Dimensions"</a>
Installation position	Any
Ports	A, P - input (pump or primary side) B - consumer (secondary side) R - reflux, tank
volumetric flow direction	Depending on type see <a href="#">Chapter 2, "Available versions, main data"</a>
Hydraulic fluid	Hydraulic oil: according to part 1 to 3; ISO VG 10 to 68 according to DIN 51519 Viscosity range: min. approx. 4, max. approx. 1500 mm <sup>2</sup> /s Optimal operation range: approx. 10 to 300 mm <sup>2</sup> /s Also suitable are biologically degradable pressure fluids types HEPG (Poly-alkyleneglycol) and HEES (Synth. Ester) at service temperatures up to approx. +70°C. Not suitable for water-based fluids and native oils (HETG).
cleanliness level	<b>ISO 4406</b> 20/17/14...18/15/12
Temperature	Ambient: approx. -40 ... +80°C, Fluid: -25 ... +80°C, Note the viscosity range! Permissible temperature during start: -40°C (observe start-viscosity!), as long as the service temperature is at least 20K higher for the following operation. Biologically degradable pressure fluids: Observe manufacturer's specifications. By consideration of the compatibility with seal material not over +70°C.
<div style="border: 1px solid #ccc; padding: 5px;"> <span style="color: blue; font-size: 2em; margin-right: 10px;">i</span> <b>Note</b>            Observe the limitation with regard to the permissible switch-on duration of the solenoid in <a href="#">Chapter 3, "Parameters"</a>.         </div>	

**Pressure and volumetric flow**

<b>Operating pressure</b>	$p_{\max} = 450$ bar (for limitation, see Table 1, 2, 3) <a href="#">Chapter 2, "Available versions, main data"</a> ; for type EM..V: $p_{\min} = 2$ bar
<b>Static overload nominal volume</b>	$2 \times P_{\max}$
<b>volumetric flow</b>	In accordance with type and size (table 1, 2, 3)

**Weight**

Screw-in valves	Type	
	EM 1	= 0.3 kg
	EM 2, EMP 2	= 0.35 kg
	EM 3, EMP 3	= 0.4 kg
	EM 4	= 0.6 kg
	EMP 4	= 0.7 kg

## Weight

BEMD 21

## 5 Assembly, operation and maintenance recommendations

### 5.1 Intended application

This valve is intended exclusively for hydraulic applications (fluid engineering). The valve meets high technical safety standards and regulations for fluid and electrical engineering.

The user must observe the safety measures and warnings in this documentation.

Essential requirements for the product to function correctly and safely:

- All information in this documentation must be observed. This applies in particular to all safety measures and warnings.
- The product must only be assembled and put into operation by qualified personnel.
- The product must only be operated within the specified technical parameters. The technical parameters are described in detail in this documentation.
- The operating and maintenance manual of the specific complete system must also always be observed.

If the product can no longer be operated safely:

Remove the product from operation and mark it accordingly. It is then not permitted to continue using or operating the product.

## 5.2 Assembly information

The product must only be installed in the complete system with standard connection components that comply with market requirements (screw fittings, hoses, pipes, etc.).

The hydraulic system must be shut down correctly prior to dismantling; this applies in particular to hydraulic systems with hydraulic accumulators.

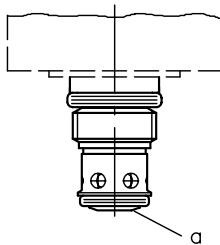

### **Danger**

**Risk to life caused by sudden movement of the hydraulic drives when dismantled incorrectly!**

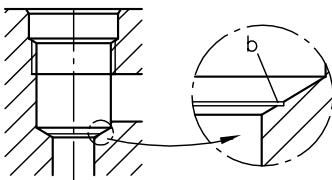

Risk of serious injury or death.

- Depressurise the hydraulic system.
- Perform safety measures in preparation for maintenance.

### 5.2.1 Notes for initial operation

In accordance with [Chapter 4, "Dimensions"](#), the 118° shoulder of the stepped bore is tolerated in its angular position to the centring bore  $\varnothing d^{H8}$  (reaming depth). This enables a larger edge force on the facial area of the housing journal when the valve is tightened and it also prevents lateral distortion of function elements which might cause sticking. This enables a max. edge force on the facial area of the tapped journal when the valve is screwed in with the correct torque and it also prevents distortion of functional valve parts which might cause malfunction (sticking).

1. Screw in the valve and tighten steadily with the correct torque (see [Chapter 4, "Dimensions"](#)).
2. Remove the valve again and check whether the journal of the valve a has produced an annular impact b at the chamfer of the stepped bore.
3. When this impact is even everything is correct and the valve can be reinstalled as described above.
4. If the ring impression b is not closed or is significantly weaker on one side, screw the valve in again and secure with a tightening torque approx. 1.2x that stated in step 1. Then check as in step 2. This is normally sufficient for making the imprint more even.
5. Then screw the valve in again as in step 1 and secure. Otherwise, rework the bore.

### 5.2.2 Creating the mounting hole

See description in [Chapter 4, "Dimensions"](#).

## 5.3 Operating instructions

### Product configuration and setting the pressure and flow rate

The statements and technical parameters in this documentation must be strictly observed. The instructions for the complete technical system must also always be followed.

#### Note

- Read the documentation carefully before usage.
- The documentation must be accessible to the operating and maintenance staff at all times.
- Keep documentation up to date after every addition or update.

#### Caution

##### Risk of injury on overloading components due to incorrect pressure settings!

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

### Purity and filtering of the hydraulic fluid

Fine contamination can significantly impair the function of a hydraulic power pack. Contamination can cause irreparable damage.

Examples of fine contamination include:

- Metal chips
- Rubber particles from hoses and seals
- Dirt due to assembly and maintenance
- Mechanical debris
- Chemical ageing of the hydraulic fluid

#### Note

Fresh hydraulic fluid from the drum does not always have the highest degree of purity. Under some circumstances the fresh hydraulic fluid must be filtered before use.

Pay attention to the cleanliness level of the hydraulic fluid in order to maintain faultless operation.

(Also see cleanliness level in [Chapter 3, "Parameters".](#))

## 5.4 Maintenance information

This product is largely maintenance-free.

Check that the product is securely fastened in the mounting hole at regular intervals, but at least once per year.

Conduct a visual inspection at regular intervals, but at least once per year, to check if the hydraulic connections are damaged. If external leakages are found, shut down and repair the system.

Clean the device surface of dust deposits and dirt at regular intervals, but at least once per year.

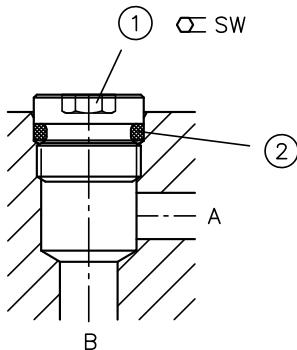

## 6 Other information

### 6.1 Accessories, spare parts and separate components

#### 6.1.1 Tapped plugs

The mounting holes can be sealed with tapped plugs if necessary; for example, if the assembly of standardised basic bodies is to be carried out with or without screw-in valves as required.
